

Based on the peer reviews of my last wireframe, and self-reflection, I've made several changes to my design.

On the login page, I've added the 'Forgot Password' button that brings the user to a new page allowing them to enter their recovery email address to be able to reset their password.

From criticism by my peers, I've changed how navigation from the 'Scratch pad' works. Now, when a user hits the back button or save button while trying to save the scratch pad, they'll be taken back to the homepage instead of to the Note editor page.

I've also improved the search page so that now it will display the three notes most related to what the user searched. The user can then select the note to view and edit it from there if needed.

I've added the option to switch users which will bring users to a new page allowing them to select all the users they have registered and register new users.

Finally, I've added buttons to the camera and audio recording feature to show how they can be saved, similarly to notes, with users being able to select tags and notebooks for them.

I feel these changes will help better represent the usability of the app in the wireframe and add to the overall user experience.
